APPARATUS AND METHOD FOR PERFORMING APPLICATION PROGRAM USING FINGERPRINT

Representative drawing

(57) Abstract:

PURPOSE: An apparatus and method for performing an application program is provided to execute a program using a fingerprint by connecting/setting an execution file of the application program corresponding to every fingerprint, and maintains a security.

CONSTITUTION: A fingerprint input part receives(10) a user's fingerprint. A fingerprint registration part generates a fingerprint execution file about the input fingerprint, in association with an execution file of a specific application program. A memory stores(16) a generated fingerprint execution file. Application program execution part compares an input fingerprint from the

fingerprint input part with a fingerprint stored in the memory. If they are identical to each other, the application program execution part performs(28) a corresponding application program. Thereby, the application program execution device executes a program by inputting a fingerprint by connecting/setting an execution file of each different application program every fingerprint, and maintains a security.
